Listening Comprehension

AI Smart Glasses

You will watch the first part (up to 3:30 min) of a report on AI glasses created by several companies. Before watching the report, here's a vocabulary exercise for you to do:
Match the words on the left to their definitions in Spanish on the right:

betting:	llamada para informar sobre ganancias
earnings call:	y aún así
throughout:	a través de, a lo largo de
to tout:	apostando
to demo:	en vez de/ en lugar de
down the road:	en el futuro
get used:	pregonar (las ventajas de algo)
embedded:	demostrar, demostración
instead of:	acostumbrarse a algo
and yet:	incorporado

Now, lets watch the video and answer the following multiple choice quiz:

1. Which company's smart glasses are explicitly called 'Ray Ban smart glasses' in the text?

A. Google
B. Xiaomi
C. Apple
D. **Meta**

2. According to Mark Zuckerberg, what will glasses that see and hear become for us?

A. a new type of phone
B. personal security devices
C. **main computing devices**
D. fashion accessories

3. What is one typical thing that users do with smart glasses, besides taking videos hands-free?

A. Shop for groceries
B. Read the morning news
C. **Listen to music without earbuds**
D. Call their friends on video

4. Why does the text suggest many companies are entering the AI glasses market now?

A. **Because there is a lot of competition for AI supremacy.**
B. Because users have asked for more wearable tech.
C. Because glasses are cheaper to produce than phones.
D. Because smartphones are no longer popular with people.

5. According to optician Dennis Lim Ah Ken, why do people not feel uncomfortable being videoed by the glasses?

A. The recording function is only used indoors.
B. The glasses have a light that tells people they are recording.
C. **The glasses look like a regular pair of glasses.**
D. They always ask people for permission first.

There are two instances of future tense used in this video:

Mark Zuckerberg: I think that personal devices like glasses that can see what we see, hear what we hear, and interact with us throughout the day **are going to become our main computing devices.**

Nora Young: And Snap, the company behind Snapchat, announced Specs, AI and augmented reality glasses **that'll arrive next year**. So why AI glasses? Because there's intense competition for AI supremacy now. And as people get used to using ChatGPT, Gemini, and other AI tools, **the pitch is many of us will want** an AI assistant embedded in our glasses.

Can you create predictions about the future of this technology using 'be going to' and 'will'.

And here's an additional question for you to answer:

Would you wear AI smart glasses?

Why or why not?

Here's the script for the video section we've watched:

Commercial: Hey, Meta. What's this?This piece is called Comedian by Mauricio.

Nora Young: Smart glasses are back on people's faces. Tech giants like Meta are betting they're the next big thing in AI.

Mark Zuckerberg: I think that personal devices like glasses that can see what we see, hear what we hear, and interact with us throughout the day **are going to become our main computing devices.**

Nora Young: On their recent earnings call, Meta touted the success of their Ray Ban smart glasses, tying them to their future AI hopes. And they have newer models in the works. But they're not the only ones getting into the glasses game.

Google commercial: Hey everyone, right now you should be seeing exactly what I'm seeing through the lens of my Android XR glasses.

Norah Young: Google recently demoed glasses with Gemini AI. Apple is rumored to be releasing AI enabled glasses down the road. Chinese company Xiaomi just released its first AI glasses available for now on mainland China.

Snapchat CEO: We've spent 11 years and invested more than $3 billion in building augmented reality glasses.

Nora Young: And Snap, the company behind Snapchat, announced Specs, AI and augmented reality glasses that'll arrive next year. So why AI glasses? Because there's intense competition for AI supremacy now. And as people get used to using ChatGPT, Gemini, and other AI tools, the pitch is many of us will want an AI assistant embedded in our glasses.

Joelle Pineau: The progress in AI is opening up new use cases for these glasses. And so it makes it more interesting to have one more device.

Nora Young: So a future of AI with us throughout the day on our wearable devices. But how about right now? Would you buy them?

Meta's glasses are already available. So, I met with optician and store owner Dennis Lim Ah Ken to talk about the market for these things.

So, why are people buying this?

LIm Ah Ken: Uh, well, what's intriguing to most people is that you're able to record video and still experience what you're looking at instead of looking at something through your phone.

Nora Young: Users typically use smart glasses to listen to music without earbuds, access the AI function, or take videos hands-free.

Norah Young: Do people ever feel uncomfortable with like, "Hey, are you you videoing me or is there ever an awkwardness in that way?"

Lim Ah Ken: I don't think so. I, you know, if maybe if you're doing something weird, but other than that, you know, not really. Nobody's really said anything. Uh, sometimes I feel like people don't even notice it, too, because it just looks like a pair of glasses.

Nora Young: Of course, your latest smartphone can do a lot of what these glasses can do. It's mostly a matter of convenience, but it does point towards a future of wearable AI tech like these glasses that's more integrated into our daily lives.

Joelle Pineau: If you have agents that have access to your visual world, not just your digital world, you're opening up new ability for the agents to be proactive about finding ways to help you. So, **it's going to be able** to build an understanding of your life that is much richer by being part of your physical life, not just your digital life.

Norah Young: But of course, the more integrated it may be in future, the more data about you need to access. For example, your calendar, your contacts.

Joelle Pineau: Ideally, we provide a lot of control for the users to be able to make those choices. The tricky part is right now the interface to a lot of these controls is pretty complicated. So, if we think about social media platforms, there are lots of ways to customize our experience and yet very few people take the time to go in their settings...
