Reading Comprehension

A New AI Device from OpenAI

OpenAI, the company that created ChatGPT, is now working on a **new AI device**. It is not ready yet, but many people are talking about it. The device is still a **prototype** (a first version), and production may start in **2027**.

What is the device like?

This new AI device will be **very small**. Some people say it could be the size of an **iPod Shuffle**, a tiny music player from years ago. Unlike a phone, it may **not have a screen**. Instead, it will use **cameras** and **microphones** to understand the world around it.
For example, the device could look at something with its camera and tell you what it is. It could also listen to your voice and answer questions. Because it is portable, people could carry it anywhere.

Why is it different?

Most devices today, like smartphones, need you to **look at a screen**. But this new device will focus on **voice and environment**. You might ask it: *"Where are my keys?"* or *"How do I say this sentence in Spanish?"* The AI will try to answer quickly, without needing to type or read.
OpenAI bought a company called **io Products** to help design this device. This shows that OpenAI is serious about making **hardware** (real devices), not just software.

How can coders use it?

For coders, this device could be very interesting. Imagine asking:

- *"Can you explain this error in my code?"*
- *"Please suggest a simple function in Python for this problem."*

The AI could answer immediately, even if you are not at your computer. This means coding help could be **everywhere**.

Conclusion

The new OpenAI device is still a mystery. But if it works well, it could change the way people use technology. Instead of always typing or looking at a screen, we may **talk to AI devices** that see and hear the world like we do.

Exercises

A. Vocabulary Match

1. Prototype	a) The part where you see text or images
2. Portable	b) A first version of something
3. Hardware	c) A part that listens to sounds
4. Microphone	d) Easy to carry
5. Screen	e) Physical parts of a computer/device

B. True or False

1. The device will be as big as a laptop.
2. It may not have a screen.
3. The device can use cameras and microphones.
4. Coders could only use it at their computer.
5. Production might start in 2027.

C. Discussion Questions

1. Would you like a device without a screen? Why/why not?
2. How could this device help you when learning coding?
3. Do you think AI devices will replace smartphones in the future?

KEY:

A. Vocabulary Match: 1b- 2d- 3e- 4c- 5a

B. True or False: 1F- 2T- 3T- 4F- 5T
