Unidad 2 | Clase 7 **Java vs Go: A quick comparison**

Java vs Go: A Quick Comparison

Java and Go (Golang) are popular programming languages but differ in philosophy and use. Java, developed by Sun Microsystems, is object-oriented, verbose, and runs on the JVM, making it highly portable. Go, developed by Google, emphasizes simplicity, concurrency, and fast compilation. Java excels in large-scale enterprise applications, while Go shines in cloud services and microservices due to its lightweight nature. Java has a vast ecosystem and mature tooling, whereas Go favors minimalism and ease of deployment. Both offer garbage collection and strong typing but approach problem-solving differently—Java through abstraction and inheritance, Go through composition and simplicity.

Quiz: Java vs. Go

1. Who developed Go?

A) Oracle
B) Microsoft
C) Google
D) IBM

2. Which language is known for fast compilation and simplicity?

A) Java
B) Python
C) Go
D) C++

3. Java runs on which platform?

A) Bare Metal
B) JVM
C) Docker
D) WebAssembly

4. Which language favors composition over inheritance?

A) Java
B) Go
C) C#
D) Ruby

5. Which is more commonly used for enterprise applications?

A) Go
B) Swift
C) Java
D) Rust

Glossary

- **Concurrency**: The ability of a program to run multiple tasks or processes at the same time. In Go, concurrency is built-in using goroutines, making it well-suited for handling many operations simultaneously (e.g., in cloud services).

- **Tooling**: Refers to the set of development tools (like debuggers, compilers, and build systems) available for a programming language. Java has mature and extensive tooling due to its long history, while Go emphasizes simplicity with built-in tools like go build, go test, etc.

- **Garbage Collection**: An automatic memory management feature that reclaims memory no longer in use by the program. Both Java and Go have garbage collectors, which help prevent memory leaks without manual intervention.
